Test Schedule and Test Procedure for 5 W to 25 Watt HF Manpack

Specification:

TxRx, HF Manpack 5W to 25 W Configuration 2.0 MHz to 29.9999 MHz

Transceiver HF MANPACK 5 W to 25 Watts Synthesized

Name of OEM/Vendor:

Tender No.

1. General

Clause No.	1.1				
Specification	Frequency Range: 2.0 MHz to 29.9999 MHz with 100 Channel Spacing and 10				
	Hz Resolution				
Status	Mandatory / Optional				
Test Purpose	The radio equipment shall be capable of operating over the				
	frequency range of 2.0 MHz to 29.9999 MHz.				
Test Configuration					
	DC Equipment Radio				
	POWER Under Test Communication				
	SUPPLY (EUT) Test Set				
	(RCTS)				
	Standard Test Setup for testing Radio				
	Test Equipment's Required:				
	DC Power Supply				
	Digital Multimeter				
	Radio Communication Test Set (RCTS)				
	Different types of connectors.				
Initial Condition	Switch "on" Radio Set and allow EUT to warm up for 30				
	minutes.				
Test Procedure	1. Connect Radio as per above set up diagram.				
1050110004410	2. Set the Lowest frequency of the given range.				
	3. Select the mode CW to check the carrier and Press PTT.				
	(The Communication Tester should be in Tx Test)				
	4. Check the frequency on low, medium and high frequency				
	range. The readings should come as per selection.

2.6
Audio Response: within 6db from 350 Hz to 2700 Hz.
Mandatory/Optional
Audio frequency response refers to the way a microphone responds to different audio frequencies.
Switch on Radio and operate all function of the Radio and observe that all the indication are readable over the display.
Switch on Radio Set and allow EUT to warm up for 30 minutes.
1. Audio Response:
Method of Measurement Constant Input Test Method a) Connect the equipment as illustrated in the standard test setup. b) Set the DC Power Supply for test voltage. c) Set the Transmitter under Test (TUT) in SSB mode to a channel and note down the channel frequency. d) Apply a 1000 Hz audio frequency to mic input from RCTS to at a level (modulation sensitivity) to produce rated RF power output. e) Set the RCTS to measure RF power output (in dB) and press PTT to record the reading as reference (by zeroing). f) Keeping the AF level constant vary the AF frequency between 350Hz and 2700 Hz and record the RF power output reading. g) Repeat steps d) through f) for other channels. h) Plot the audio frequency response graph and compare with the specification.

Finding							

Clause No.	2.7
Specification	Side Tone Level: Better than 0.1 mw into 150 Ω load for 5 mV of audio input
•	at 1 KHz.
Status	Mandatory/Optional
Test Purpose	Side tone is the effect of sound that is picked up by the telephone's mouthpiece and introduced (at low level) into the earpiece of the same handset, acting as feedback. In wireless telegraphy (WT) and land mobile radio, side tone is the audible indication of a CW signal as the operator sends Morse Code. It acts as feedback to the operator that what they are sending is what is intended.
Test Configuration	Switch on Radio and operate all function of the Radio and observe that all the indication is readable over the display.
Initial Condition	Switch on Radio Set and allow EUT to warm up for 30 minutes.
Test Procedure	

	2.8
Specification	Modulation Sensitivity: 1 to 10 mV at 1 KHz for full power under SSB mode.
Status	Mandatory/Optional
Test Purpose	Modulation Sensitivity is the input rms voltage level that must be applied to the input terminals of the microphone circuit to produce the rated RF output power.
Test Configuration	Switch on Radio and operate all function of the Radio and observe that all the indication are readable over the display.
Initial Condition	Switch on Radio Set and allow EUT to warm up for 30 minutes.
Test Procedure	Method of Measurement

Serial Number of Equipment:	•••

1. RECEIVER

Clause No.	3.1
Specification	Receiver Sensitivity: -111 dBm for 10 dB SINAD or better
Status	Mandatory/Optional
Test Purpose	Receiver Sensitivity is the level of receiver input signal modulated at a specified audio frequency that will result in the specified Signal to Noise ratio at the output of the receiver. The maximum audio output obtained at maximum volume control setting, without exceeding the specified distortion, when an input signal modulated at a specified audio frequency is applied to the receiver.
Test	As per above standard set up.
Configuration	
Initial Condition	Switch on Radio Set and allow EUT to warm up for 30 minutes.
Test Procedure	Method of Measurement a) Connect the equipment as illustrated. b) Set the EUT in SSB mode and apply an un modulated signal of the set channel frequency from RCTS to the receiver input terminals. c) Keep the receiver volume control to maximum and apply modulating audio signal of 1KHz to obtain maximum audio output. d) Record the maximum audio output (in W). e) Record the input signal level (i.e. [Signal + Noise] in µV and dBm) f) Switch off the input signal and record the Noise level (in dBm). g) Set the input signal level at 10 times (up 20dB) and measure distortion. h) Repeat steps b) to g) for CW mode. i) Repeat steps b) to h) for other channels.

Clause No.	3.2
Specification	Image Rejection : ≥ 70 db or better
Status	Mandatory/Optional
Test Purpose	The image rejection ratio or image frequency rejection ratio, is the ratio of the intermediate-frequency (IF) signal level (in dB) produced by the desired input frequency to that produced by the image frequency.
Test	As per above standard set up.
Configuration	
Initial Condition	Switch on Radio Set and allow EUT to warm up for 30 minutes.
Test Procedure	Method of Measurement a) Connect the equipment as illustrated in the standard test setup. b) Set the DC Power Supply for test voltage. c) Set the Equipment Under Test (EUT) in SSB mode to a channel and note down the d) channel frequency. e) Apply an un-modulated RF signal to obtain 10dB SINAD from RCTS(cf) f) Apply Image frequency to EUT and increase signal input level to obtain the 10dB SINAD.

g) The difference in the input signal level gives the image rejection ratio. h) Repeat steps c) to f) for other channels. Test and Measurement Record SINAD Input SINAD Freq. Clause No.	3.5
Specification	Audio Response: With in ± 6 db from 350 Hz to 2700 Hz
Status	Mandatory/Optional
Test Purpose	The Audio Response denotes the characteristic of the audio output of a receiver over a specified continuous audio frequency range with constant RF input signal level to the receiver.
Test	As per above standard set up.
Configuration	
Initial Condition	Switch on Radio Set and allow EUT to warm up for 30 minutes.

Test Procedure

Method of Measurement

- a) Connect the equipment as illustrated in the standard test setup.
- b) Set the DC Power Supply for test voltage.
- c) Set the Equipment under Test (EUT) in SSB mode to a channel and note down the channel frequency.
- d) Apply an un-modulated RF signal at 10 times (up 20dB) at 10 dB SINAD from RCTS to the receiver input terminals.
- e) Record the audio output level (in dB) as reference (by zeroing).
- f) Keeping the RF signal level constant ; vary the RF signal frequency to obtain audio output (beats) of 1000Hz and record the audio output level (in dB) as reference (by zeroing).
- g) Vary the RF signal frequency to obtain audio output (beats) from 350Hz to 2700Hz and record the audio output level (in dB).
- h) Repeat steps c) to g) for other channels.
